Differential equations are used to model dynamic systems that change over time, such as population growth, spread of diseases, and physical processes, facilitating predictions and analysis of these systems. What types of problems are solved using linear programming in Unit 11? Problems involving resource allocation, cost minimization, profit maximization, and production scheduling are addressed using linear programming techniques covered in the unit. Are there any real-life case studies included in Unit 11 to illustrate mathematical modeling? Yes, the unit includes case studies from industries like manufacturing, transportation, and healthcare to demonstrate how mathematical models optimize processes and decision-making. What skills should students develop after completing Unit 11 of Mathematical Models with Applications TESCOS? Students should be able to formulate mathematical models for complex problems, apply appropriate solution techniques, interpret results, and understand the practical implications of their models.
