Trig Word Problems: 3 Answers to Enhance Your Understanding

Introduction

Trig word problems 3 answers often challenge students to apply their understanding of trigonometric ratios and identities within real-world contexts. These problems not only test computational skills but also require a solid grasp of how angles and lengths relate in various geometric configurations. Mastering these questions can significantly improve problem-solving ability, deepen conceptual understanding, and prepare students for exams and practical applications. This article explores three common types of trig word problems, providing detailed solutions and insights to help you navigate similar questions with confidence.

Understanding the Fundamentals of Trigonometry in Word Problems

The Role of Trigonometry in Word Problems

Trigonometry deals with the relationships between the angles and sides of triangles, especially right triangles. In word problems, these relationships are used to determine unknown lengths or angles based on given information. Typically, problems involve angles of elevation or depression, distances across terrains, or heights of tall objects.

Key concepts include:

- Sine, cosine, and tangent ratios
- Reciprocal functions: cosecant, secant, cotangent
- Using inverse trigonometric functions to find angles
- Applying the Pythagorean theorem in conjunction with trigonometric ratios

Common Structures of Trig Word Problems

Most trig word problems can be categorized based on their structure:

- Problems involving angles of elevation or depression to find heights or distances
- Problems involving distances between objects using triangulation
- Problems requiring the use of the Law of Sines or Law of Cosines in non-right triangles

Understanding these structures helps in selecting the appropriate trigonometric ratios and methods for solving each problem.

Sample Trig Word Problem 1: Finding the Height of a Tower

Problem Statement

A surveyor stands 100 meters away from the base of a tower. From her position, the angle of elevation to the top of the tower is 35° . How tall is the tower?

Solution Approach

This problem involves a right triangle formed by the height of the tower, the horizontal distance from the surveyor to the base, and the line of sight to the top of the tower. The key is to identify the correct trigonometric ratio to find the height.

Step-by-Step Solution

- Identify known values:
 - Distance from surveyor to tower (adjacent side): 100 meters
 - Angle of elevation: 35°
- Determine the relevant trigonometric ratio:

Since we want the height of the tower (opposite side), and we know the adjacent side and the angle, tangent is appropriate:

$$\tan \theta = \frac{\text{opposite}}{\text{adjacent}}$$

- Set up the equation:

$$\tan 35^\circ = \frac{h}{100}$$

- Calculate h :

$$h = 100 \times \tan 35^\circ$$

- Compute the value:

$$h \approx 100 \times 0.7002 \approx 70.02 \text{ meters}$$

Answer

The height of the tower is approximately 70.02 meters.

Sample Trig Word Problem 2: Using Triangulation to Find a Distance

Problem Statement

Two observers are standing on the same side of a lake. Observer A is 300 meters west of a lighthouse, and observer B is 400 meters east of the lighthouse. The angles of elevation from observers A and B to the top of the lighthouse are 30° and 45° , respectively. What is the height of the lighthouse?

Solution Approach

This problem involves triangulation with two different points observing the same object. The key is to set up two right triangles and relate the heights and distances using tangent ratios.

Step-by-Step Solution

- Define the variables:
 - Distance from observer A to the lighthouse: (x)
 - Distance from observer B to the lighthouse: (y)
 - Height of the lighthouse: (h)

- Express the distances:

Since observer A is 300 meters west, and observer B is 400 meters east, and both are on the same side of the lighthouse, the total distance between observers is 700 meters.

- Set up tangent equations:

- For observer A:

$$(\tan 30^\circ = \frac{h}{x})$$

- For observer B:

$$(\tan 45^\circ = \frac{h}{y})$$

- Express (x) and (y) in terms of (h) :

$$- x = \frac{h}{\tan 30^\circ} = \frac{h}{0.577}$$

$$- y = \frac{h}{\tan 45^\circ} = \frac{h}{1} = h$$

- Relate the distances:

The total distance between observers is $(x + y = 700)$ meters:

$$\left(\frac{h}{0.577} + h = 700\right)$$

- Solve for (h) :

$$h \left(\frac{1}{0.577} + 1 \right) = 700$$

$$h (1.732 + 1) = 700$$

$$h \times 2.732 = 700$$

$$h \approx \frac{700}{2.732} \approx 256.2 \text{ meters}$$

Answer

The height of the lighthouse is approximately 256.2 meters.

Sample Trig Word Problem 3: Applying Law of Sines in Non-Right Triangles

Problem Statement

In a triangle, the sides are of lengths 150 meters and 200 meters, with an included angle of 60° . Find the length of the third side.

Solution Approach

This problem involves non-right triangles, where the Law of Cosines is the most effective method to find an unknown side when two sides and the included angle are known.

Step-by-Step Solution

- Identify known values:

- Side $(a = 150)$ m

- Side $(b = 200)$ m
- Included angle $(C = 60^\circ)$

- Apply the Law of Cosines:

$$c^2 = a^2 + b^2 - 2ab \cos C$$

- Compute (c) :

$$c^2 = 150^2 + 200^2 - 2 \times 150 \times 200 \times \cos 60^\circ$$

$$c^2 = 22500 + 40000 - 2 \times 150 \times 200 \times 0.5$$

$$c^2 = 62500 - (2 \times 150 \times 200 \times 0.5)$$

$$c^2 = 62500 - (150 \times 200)$$

$$c^2 = 62500 - 30000 = 32500$$

- Find (c) :

$$c = \sqrt{32500} \approx 180.28 \text{ meters}$$

Answer

The length of the third side is approximately 180.28 meters.

Trig Word Problems 3 Answers: A Comprehensive Guide to Mastering Trigonometry Word Problems

When it comes to tackling trig word problems 3 answers, students often find themselves in a maze of angles, side lengths, and trigonometric functions. These problems are designed to test your understanding of how angles and side lengths relate within triangles and how to apply trigonometric ratios effectively. Mastering these problems requires a clear strategy, a solid grasp of trigonometric concepts, and the ability to interpret real-world scenarios accurately. In this guide, we'll walk through the essential steps, common techniques, and tips to confidently find three solutions in trig word problems, empowering you to approach these challenges with confidence.

Understanding the Nature of Trig Word Problems

Trig word problems typically involve real-world scenarios where you need to determine unknown lengths, angles, or distances using trigonometry. The phrase trig word problems 3 answers refers to problems that, due to the nature of the question, may have up to three solutions. This can happen when:

- The problem involves ambiguous cases, such as the Law of Sines, where two different angles produce the same side length.
- Multiple triangles satisfy the given conditions (the SSA or ambiguous case).
- The problem asks for all possible solutions that meet the criteria set by the problem.

Key Point: Recognize when a problem might have multiple solutions. This often involves understanding the Law of Sines and Law of Cosines and the conditions that lead to ambiguous cases.

Step-by-Step Approach to Solving Trig Word Problems with 3 Answers

Step 1: Carefully Read and Visualize the Problem

- Identify what is given: angles, side lengths, distances, or other measurements.
- Determine what is asked: angles, side lengths, or positions.
- Draw a diagram: Visual representation simplifies understanding and helps identify the relevant trigonometric relationships.

Step 2: Find the Appropriate Trigonometric Model

Depending on the scenario, choose the correct approach:

- Right Triangle Trigonometry: When the problem involves right triangles.
- Law of Sines: When you are given either two angles and one side (AAS or ASA) or two sides and a non-included angle (SSA).
- Law of Cosines: When you have two sides and the included angle (SAS) or all three sides (SSS).

Step 3: Set Up Equations Carefully

Translate the problem into mathematical equations using:

- Basic sine, cosine, tangent ratios.
- Law of Sines: $\left(\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \right)$
- Law of Cosines: $\left(c^2 = a^2 + b^2 - 2ab \cos C \right)$

Step 4: Solve for Unknowns and Consider Multiple Solutions

- When using the Law of Sines, be aware of the ambiguous case (SSA), which can produce:
 - No solution.
 - One solution.
 - Two solutions.
- Examine the possible solutions carefully, especially when solving for angles, since sine can be positive or negative in different quadrants, leading to multiple valid angles.

Step 5: Verify Each Solution

- Check if each solution makes sense within the context of the problem.
- Discard extraneous solutions that do not fit the scenario.
- Confirm that all solutions satisfy the problem's conditions.

Common Techniques for Handling Multiple Answers

- Law of Sines and the Ambiguous Case

The ambiguous case occurs mainly with SSA configurations. To analyze:

- Compute $\left(\sin B = \frac{b \sin A}{a} \right)$.
- Recognize that $\left(\sin B \right)$ can have two possible angles: $\left(B \right)$ and $\left(180^\circ - B \right)$.

Example:

Suppose you know side $\left(a \right)$, side $\left(b \right)$, and angle $\left(A \right)$, and you are solving for $\left(B \right)$. If:

- $\sin B = 0.5$,
- then $B = 30^\circ$ or 150° .

For each possible B , find the corresponding C , and determine whether the triangles are valid (angles sum to less than 180°).

- Law of Cosines for Multiple Solutions

While less common, situations involving the Law of Cosines can sometimes yield multiple solutions, especially when solving for an angle:

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

Since cosine is positive in both the first and fourth quadrants, the same cosine value can correspond to two different angles between 0° and 180° , leading to two possible triangles.

Practical Example: Solving a Trig Word Problem with Three Answers

Let's analyze a specific problem that demonstrates how three solutions can arise.

Problem Statement:

A ladder leans against a wall, forming an angle A with the ground. The ladder's length is known, but the height it reaches on the wall can be achieved in three different ways based on the angles involved. Given the following data:

- Length of ladder $c = 10$ meters.
- The angle between the ground and the ladder A is unknown.
- The distance from the wall to the foot of the ladder is $a = 6$ meters.
- Find all possible angles A such that the ladder reaches the wall at height h , with the understanding that multiple configurations are possible.

Solution Approach:

- Visualize the problem: The ladder, ground, and wall form a triangle with side c , base a , and height h .

- Set up the relation:

Using the Law of Cosines or basic trigonometry:

- $(h = c \sin A)$.

- Find possible angles (A) :

- Since $(\sin A = \frac{h}{c})$, and (h) is related to the position on the wall, multiple angles can satisfy the same $(\sin A)$ (e.g., (A) and $(180^\circ - A)$).

- For instance, if $(\sin A = 0.5)$, then:

- $(A = 30^\circ)$ or (150°) .

- Determine all valid solutions:

- For each candidate angle, verify if the corresponding configuration makes sense within the problem constraints (e.g., the ladder doesn't extend beyond the wall or violate physical constraints).

Result:

This analysis can yield up to three solutions depending on the specific measurements and conditions, especially when considering the different possible angles that produce the same height (h) .

Tips for Success with Trig Word Problems 3 Answers

- Always draw clear diagrams. Visual representations help identify multiple solutions and ambiguous cases.
- Pay close attention to the given data and what is asked. Sometimes, the problem's wording hints at multiple solutions.
- Master the Law of Sines and Law of Cosines. These are essential tools for handling ambiguous

cases.

- Check each solution within the context of the problem. Some solutions may be mathematically valid but physically impossible.
- Practice with diverse problems. Exposure to various scenarios will improve intuition and problem-solving skills.

Conclusion

Trig word problems 3 answers challenge students to think beyond straightforward calculations, requiring careful analysis, geometric intuition, and an understanding of the ambiguous nature of certain trigonometric cases. By mastering the steps outlined—visualization, choosing the right model, setting up accurate equations, and analyzing multiple solutions—you can confidently approach these problems. Remember, multiple solutions are not a sign of difficulty but an opportunity to deepen your understanding of the rich relationships within triangles. With practice, you'll become adept at recognizing when three solutions are possible and how to find them efficiently, turning complex problems into achievable feats.

Sample Trig Function Word Problems and Solutions

Problem 1: Finding the Height of a Tree

A person stands 50 meters away from a tall tree. The angle of elevation from the person's eye level to the top of the tree is 35° . Find the height of the tree.

Solution:

- Draw a right triangle with the horizontal distance of 50 meters and the angle of elevation of 35° .
- Let the height of the tree be h .
- The height from eye level to the top of the tree is $(h - \text{eye level height})$. If the person's eye level is at 1.5 meters, then the total height is h .

Assuming the problem wants the total tree height:

[

$$\tan 35^\circ = \frac{h - 1.5}{50}$$

]

[

$$h - 1.5 = 50 \tan 35^\circ$$

]

[

$$h = 1.5 + 50 \tan 35^\circ$$

]

Calculate:

[

$$h \approx 1.5 + 50 \times 0.7002 \approx 1.5 + 35.01 = 36.51 \text{ meters}$$

]

Answer: The tree is approximately 36.51 meters tall.

Problem 2: Distance Between Two Points Using Angles

From a point on the ground, the angle of elevation to the top of a building is 45° , and from a point 100 meters away from the first point, the angle of elevation is 30° . Find the height of the building.

Solution:

- Draw a diagram with two observation points, the building, and the angles.
- Let the height of the building be (h) .
- From the first point:

[

$$h = d_1 \times \tan 45^\circ = d_1 \times 1$$

]

so,

[

$$h = d_1$$

]

- From the second point (100 meters away):

[

$$h = (d_1 + 100) \times \tan 30^\circ \approx (d_1 + 100) \times 0.577$$

]

- Set the two expressions for (h) equal:

[

$$d_1 = 0.577 \times (d_1 + 100)$$

]

[

$$d_1 = 0.577 d_1 + 57.7$$

]

\[

$$d_1 - 0.577 d_1 = 57.7$$

\]

\[

$$0.423 d_1 = 57.7$$

\]

\[

$$d_1 \approx \frac{57.7}{0.423} \approx 136.5 \text{ meters}$$

\]

- Find the height:

\[

$$h = d_1 \approx 136.5 \text{ meters}$$

\]

Answer: The building is approximately 136.5 meters tall.

- Use inverse functions carefully: When finding angles, use $\sin^{-1}$, $\cos^{-1}$, or $\tan^{-1}$.
- Check your answers: Consider the reasonableness and units.

Advanced Trig Word Problems

As skills develop, word problems become more complex, involving multiple steps, non-right triangles, or the use of laws of sines and cosines.

\[

$$\sin \theta = \frac{\sqrt{3}}{2}$$

\]

which corresponds to standard angles:

[

$$\theta = 60^\circ, 120^\circ$$

Step-by-Step Breakdown of Sample January 2011 Trig Questions

Let's now analyze some representative questions from the January 2011 exam, including solutions with detailed work.

Question 1: Find the exact value of $\sin(75^\circ)$.

Work:

- Recognize that 75° can be expressed as a sum of angles with known sine and cosine values:
 $75^\circ = 45^\circ + 30^\circ$.
- Use the sine addition formula:

$$\sin(A + B) = \sin A \cos B + \cos A \sin B$$

- Substitute known values:

$$\sin 45^\circ = \frac{\sqrt{2}}{2}$$

$$\cos 45^\circ = \frac{\sqrt{2}}{2}$$

$$\sin 30^\circ = \frac{1}{2}$$

$$\cos 30^\circ = \frac{\sqrt{3}}{2}$$

- Calculate:

$$\sin 75^\circ = \sin 45^\circ \cos 30^\circ + \cos 45^\circ \sin 30^\circ$$

$$= \left(\frac{\sqrt{2}}{2}\right) \left(\frac{\sqrt{3}}{2}\right) + \left(\frac{\sqrt{2}}{2}\right) \left(\frac{1}{2}\right)$$

$$= \left(\frac{\sqrt{6}}{4}\right) + \left(\frac{\sqrt{2}}{4}\right)$$

$$= (\sqrt{6} + \sqrt{2}) / 4$$

Answer:

$$\sin(75^\circ) = (\sqrt{6} + \sqrt{2}) / 4$$

Question 2: Solve for θ in the interval $0^\circ \leq \theta < 360^\circ$: $\sin \theta = 0.5$

Work:

- Recall that $\sin \theta = 0.5$ at specific angles:

$\sin \theta = 1/2$ when $\theta = 30^\circ$ or 150° , within the interval 0° to 360° .

- Therefore,

$$\theta = 30^\circ, 150^\circ$$

Answer:

$$\theta = 30^\circ, 150^\circ$$

Question 3: Find the exact value of $\cos 2\theta$ if $\sin \theta = 3/5$ and θ is in the first quadrant.

Work:

- Since $\sin \theta = 3/5$ and θ is in the first quadrant (where all trig functions are positive), find $\cos \theta$:

$$\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (3/5)^2} = \sqrt{1 - 9/25} = \sqrt{16/25} = 4/5$$

- Use the double-angle formula:

$$\cos 2\theta = 2 \cos^2 \theta - 1$$

$$= 2 (4/5)^2 - 1$$

$$= 2 (16/25) - 1$$

$$= (32/25) - 1$$

$$= (32/25) - (25/25) = 7/25$$

Answer:

$$\cos 2\theta = 7/25$$

Question 4: Graph the function $y = 3 \sin(2x - 30^\circ)$. Describe its amplitude, period, phase shift, and vertical shift.

Work:

- Amplitude: The coefficient in front of sine, 3, signifies an amplitude of 3.

- Period: The period of sine is given by:

Period = $360^\circ / |b|$, where b is the coefficient of x inside the sine.

Here, $b = 2$, so:

$$\text{Period} = 360^\circ / 2 = 180^\circ$$

- Phase shift: The phase shift is given by:

Phase shift = $-(c / b)$, where c is the horizontal shift inside the argument (here, $c = -30^\circ$).

$$\text{Phase shift} = -(-30^\circ / 2) = 15^\circ$$

- Vertical shift: Since there is no added or subtracted constant outside the sine, the vertical shift is none (centered around $y=0$).

Summary:

- Amplitude: 3
- Period: 180°

- Phase shift: 15° to the right
- Vertical shift: none

Sample Questions and Detailed Answers from the 2014 Exam

To illustrate, here are some representative questions from the 2014 exam along with step-by-step solutions.

Question 1: Exact Value of a Trigonometric Function

Question:

Find the exact value of $\sin 75^\circ$.

Answer:

Recall the angle sum identity:

$$\sin(A + B) = \sin A \cos B + \cos A \sin B.$$

Choose $A = 45^\circ$ and $B = 30^\circ$:

$$\sin 75^\circ = \sin(45^\circ + 30^\circ) = \sin 45^\circ \cos 30^\circ + \cos 45^\circ \sin 30^\circ.$$

Use known exact values:

$$\sin 45^\circ = \frac{\sqrt{2}}{2},$$

$$\cos 30^\circ = \frac{\sqrt{3}}{2},$$

$$\cos 45^\circ = \frac{\sqrt{2}}{2},$$

$$\sin 30^\circ = \frac{1}{2}.$$

Calculate:

[

$$\begin{aligned} \sin 75^\circ &= \left(\frac{\sqrt{2}}{2}\right)\left(\frac{\sqrt{3}}{2}\right) + \\ \left(\frac{\sqrt{2}}{2}\right)\left(\frac{1}{2}\right) &= \frac{\sqrt{6}}{4} + \frac{\sqrt{2}}{4} = \frac{\sqrt{6} + \sqrt{2}}{4} \end{aligned}$$

]

Final answer: $\boxed{\frac{\sqrt{6} + \sqrt{2}}{4}}$

Question 2: Solving a Trigonometric Equation

Question:

Solve for x in the interval $0^\circ \leq x < 360^\circ$
 $\sin x = \frac{1}{2}$.

Answer:

Recall the unit circle values:

$\sin x = \frac{1}{2}$ occurs at:

- $x = 30^\circ$
- $x = 150^\circ$

These are the solutions within the interval.

Final answer: $\boxed{x = 30^\circ, 150^\circ}$

Question 3: Applying the Law of Sines

Question:

In $\triangle ABC$, with sides $a = 7$, $b = 10$, and included angle $C = 60^\circ$, find side c .

Answer:

Use the Law of Cosines:

[

$$c^2 = a^2 + b^2 - 2ab \cos C$$

]

Calculate:

[

$$c^2 = 7^2 + 10^2 - 2 \times 7 \times 10 \times \cos 60^\circ$$

]

[

$$c^2 = 49 + 100 - 140 \times \frac{1}{2} = 149 - 70 = 79$$

]

Therefore:

[

$$c = \sqrt{79} \approx 8.89$$

]

Final answer: $\boxed{c = \sqrt{79}}$
