Understanding Radioactive Decay and Its Significance

What Is Radioactive Decay?

Radioactive decay is a natural process by which unstable atomic nuclei lose energy by emitting radiation. This process results in the transformation of the original nucleus into a different element or a different isotope of the same element. The decay occurs spontaneously and is governed by probabilistic laws, meaning that while the decay rate for a large number of atoms is predictable, the exact timing for an individual atom is random.

Types of Radiation Emitted

During decay, an atom may emit:

- **Alpha particles:** Consist of 2 protons and 2 neutrons, with a positive charge. They have low penetration power but can cause damage if ingested or inhaled.
- **Beta particles:** Electrons or positrons emitted when a neutron converts into a proton or vice versa. They have moderate penetration and require shielding such as plastic or glass.
- **Gamma rays:** High-energy electromagnetic radiation with high penetration power, often accompanying alpha or beta decay.

Importance of Decay Practice Questions

Practicing questions about decay helps students:

- Understand the underlying physics principles.
- Develop problem-solving skills related to decay calculations.

- Prepare for assessments and exams.
- Connect theoretical concepts with real-world applications, such as radiometric dating and nuclear medicine.

Common Types of Decay Practice Questions and Answers

1. Decay Calculations

These questions involve calculating the remaining quantity of a radioactive substance after a certain period or determining the half-life.

Example Question:

A sample of radioactive isotope has a half-life of 10 hours. How much of a 100 g sample remains after 30 hours?

Answer:

Since the half-life is 10 hours, the sample halves every 10 hours.

- After 10 hours: 100 g ? 50 g
- After 20 hours: 50 g ? 25 g
- After 30 hours: 25 g ? 12.5 g

Remaining sample: 12.5 grams

2. Understanding Half-Life and Decay Constants

Questions may ask students to relate half-life to decay constants or to derive one from the other.

Example Question:

Given a decay constant (λ) of 0.0693 per hour, what is the half-life of the isotope?

Answer:

Using the relationship:

$$T_{1/2} = \frac{\ln 2}{\lambda}$$

$$T_{1/2} = \frac{0.693}{0.0693} \approx 10 \text{ hours}$$

3. Radioactive Dating Problems

These involve calculating the age of artifacts or rocks based on known decay rates.

Example Question:

A rock contains 25% of its original uranium-238. The half-life of uranium-238 is 4.5 billion years. How old is the rock?

Answer:

- Remaining fraction: 25% = $\frac{1}{4}$
- Number of half-lives: 2 (since $\frac{1}{4} = (\frac{1}{2})^2$)
- Age: $2 \times 4.5 \text{ billion years} = 9 \text{ billion years}$

4. Decay Series and Chain Reactions

Questions may explore decay chains where a series of decays leads to stable isotopes.

Example Question:

Describe the decay series of uranium-238 and identify its end product.

Answer:

Uranium-238 undergoes a series of alpha and beta decays, transforming through various isotopes such as thorium-234, protactinium-234, and others, until reaching a stable isotope, lead-206.

$$_{92}^{238}\mathrm{U} \rightarrow _{90}^{234}\mathrm{Th} + _2^4\mathrm{He}$$

$$___$$

This balances the atomic and mass numbers.

Question 3: Calculate the Remaining Isotopes After a Given Time

Given: A sample of isotope with a half-life of 10 hours is initially 100 grams. How much remains after 30 hours?

Solution: Since each half-life reduces the amount by half:

- After 30 hours: 12.5 grams

Answer: 12.5 grams remain.

Question 4: Determine the Decay Constant

Given: The half-life of a radioactive isotope is 20 hours. Find the decay constant (λ) .

Solution:

$$___$$

$$\lambda = \frac{\ln 2}{T_{1/2}} = \frac{0.693}{20 \text{ hours}} \approx 0.03465 \text{ hr}^{-1}$$

$$___$$

Answer: $(\lambda \approx 0.03465 \text{ hr}^{-1})$

Question 5: Interpret a Decay Graph
